

ArchiLudo

A Ludo game for Acorn Archimedes

Contents

Documentation Building from source

Documentation

See docs/ for the full project documentation: ARCHITECTURE.md, BUILDCHAIN.md, GAME_LOGIC.md, BOARD_LAYOUT.md, OSLIB.md, LIBARCHIE.md, GRAPHICS_TOOLING.md; plus riscos_wimp_reference.md for the WIMP/SWI/ message API reference, and CREDITS.md for everything this project is built on or derived from.

Building from source

Prerequisites

Tool	Purpose	Install
ArchieSDK	ARM2-targeting cross-compiler (GCC 8.5.0), bundled OSLib	<pre>git clone https://gitlab.com/_targz/archiesdk.git ~/riscos-dev/archiesdk && cd ~/riscos-dev/archiesdk && ./build.sh</pre>
Arculator	Acorn Archimedes emulator, for testing	already installed at D:\Retro\Acorn\Arculator_V2.2_Windows
pandoc	optional: README.md -> README.pdf	<pre>sudo apt install pandoc texlive-xetex</pre>
Python 3 + Pillow	tools/riscos_sprite.py, pip install Pillow the PNG->Sprite converter	

.env setup

Copy .env.example to .env and set:

```
ARCHIESDK = /home/xahmol/riscos-dev/archiesdk
ARCULATOR_HOSTFS = /mnt/d/Retro/Acorn/Arculator_V2.2_Windows/hostfs
```

.env is gitignored — never commit it.

Make targets

Target	Effect
<code>make / make all</code>	build the <code>build/!ArchiLudo</code> application directory
<code>make test</code>	build and run the game-logic unit tests with the host compiler (no ArchieSDK/Arculator needed)
<code>make clean</code>	remove <code>build/</code>
<code>make deploy</code>	copy <code>build/!ArchiLudo</code> to the Arculator hostfs folder
<code>make zip</code>	versioned release archive (<code>build/ArchiLudo-vX.Y.Z-<timestamp>.zip</code>), RISC OS filetypes preserved
<code>make assets</code>	regenerate the pawn sprites and app icon from their Python generators
<code>make docs</code>	regenerate <code>README.pdf</code> via pandoc
<code>make asm</code>	emit generated ARM assembly for the current sources

Testing: boot `configs/ArchiLudo-ARM3-4MB.cfg` (matches real ARM3/4MB hardware) or `configs/ArchiLudo-ARM2-1MB.cfg` (stock ARM2/1MB compatibility check) in Arculator with the RISC OS 3.10 ROM, then double-click `!ArchiLudo` from HostFS via the Filer (see `docs/BUILDCHAIN.md`'s "Application directory" section for its structure).

Status: Phase 1 (see `docs/ARCHITECTURE.md`'s Roadmap) – a playable core loop, extensively live-tested and refined in Arculator across many rounds of feedback (see `docs/ARCHITECTURE.md`'s round history).
